Methods

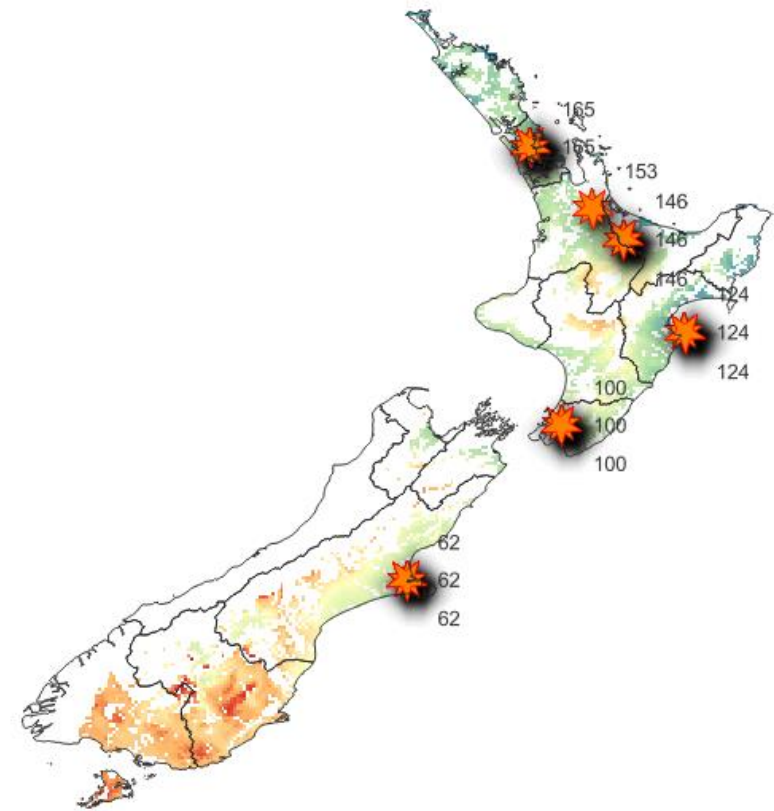

Results

Protein productivity
(kg/ha per year)

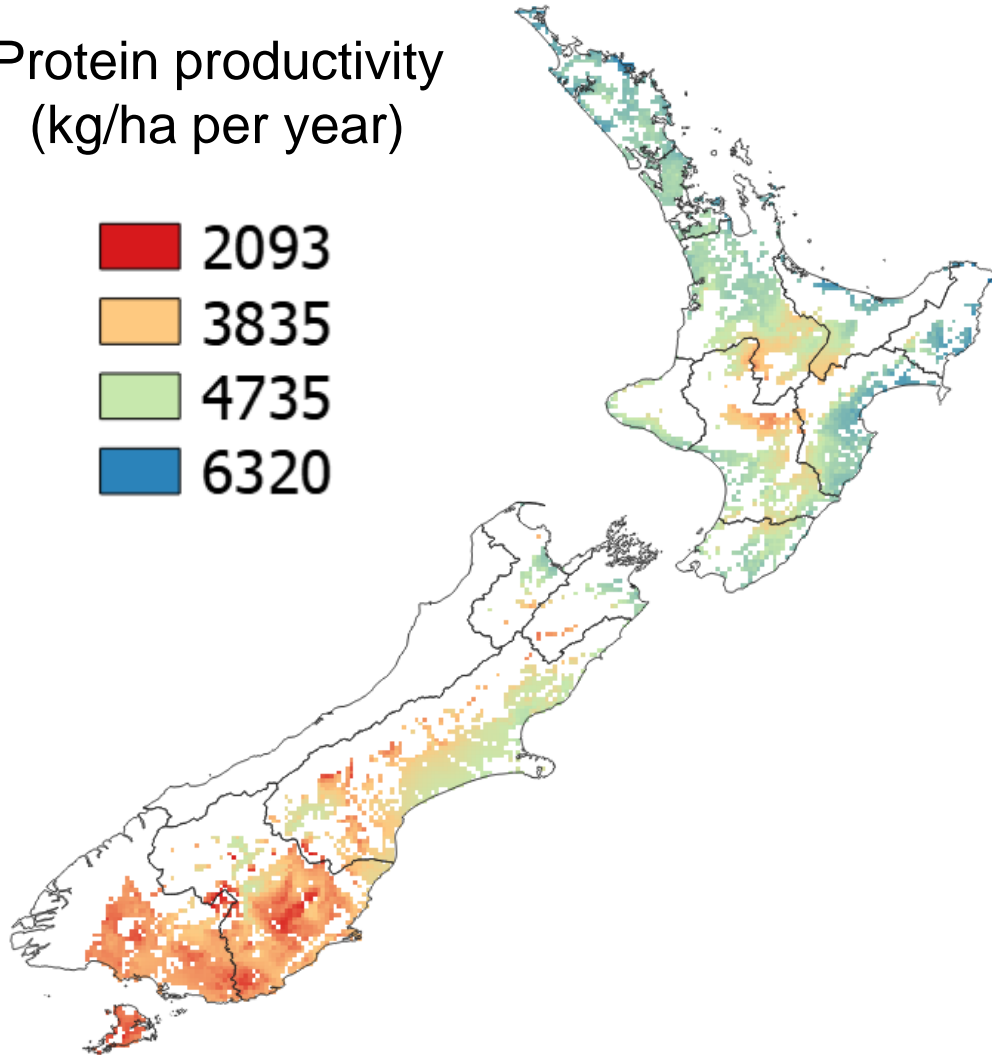

Annual supply of lucerne
biomass to processing plants
(kg per year)

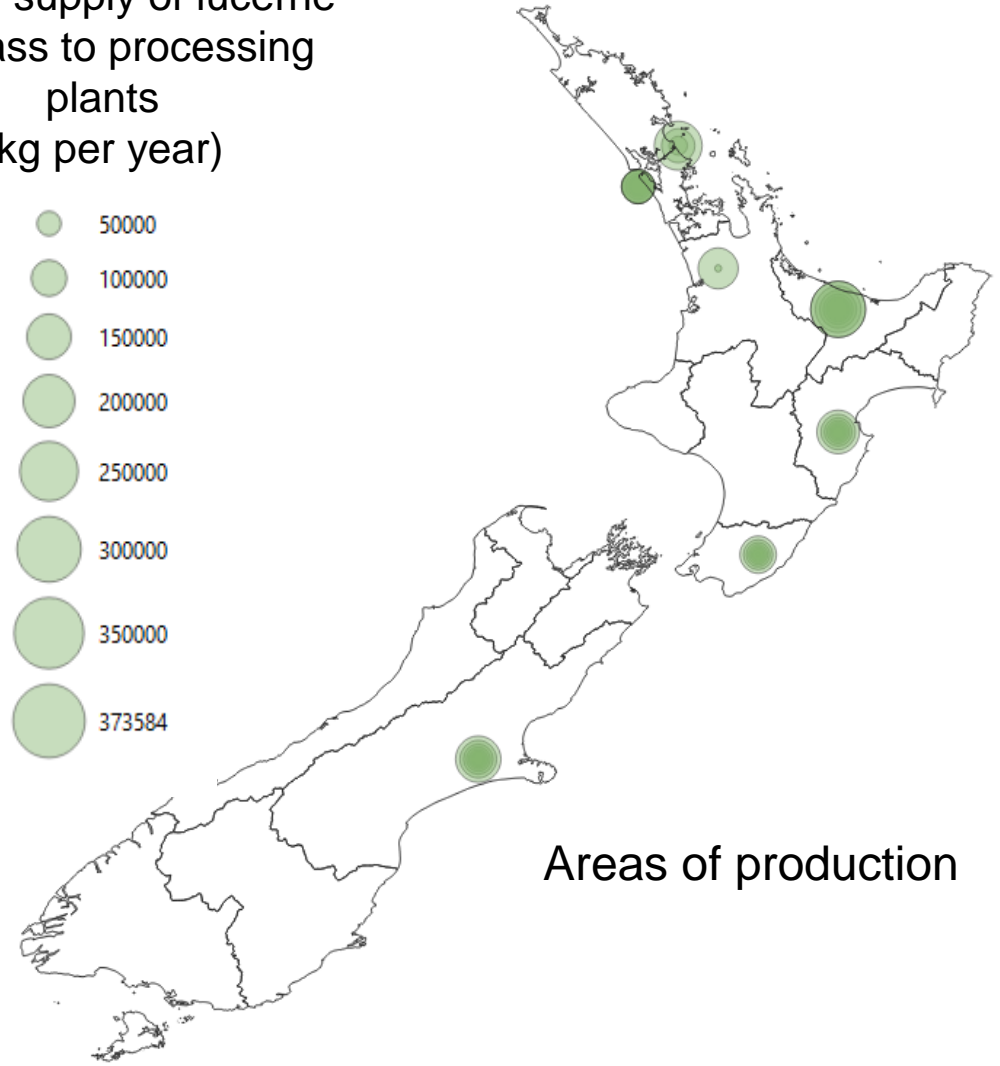

Processing plant locations

Estimated production areas to supply processing industry

Protein productivity
(kg/ha per year)

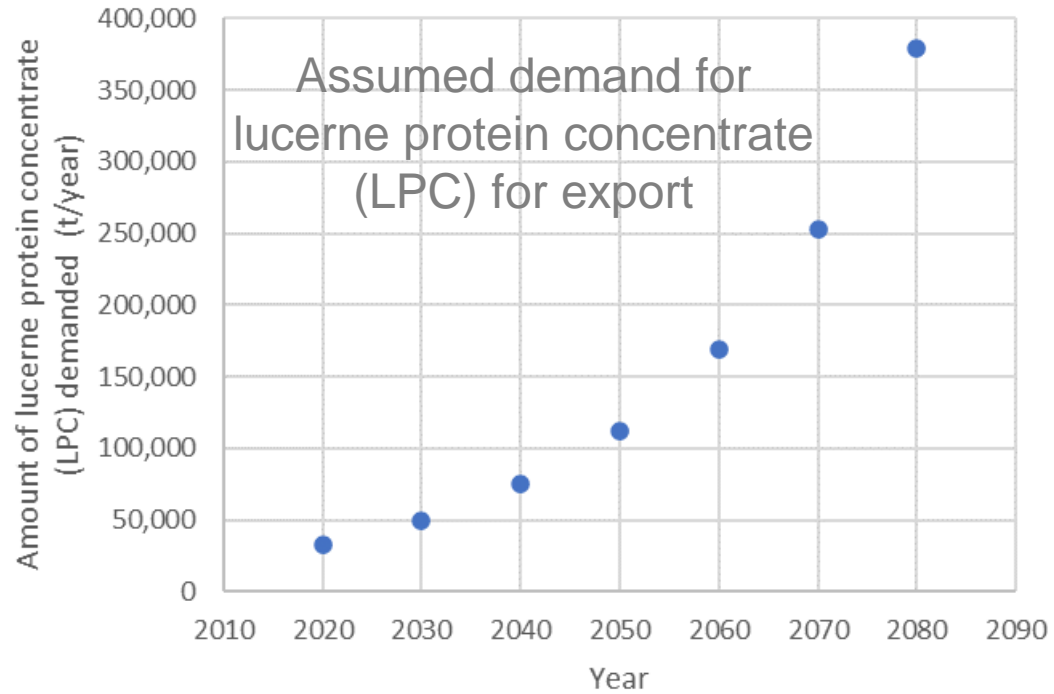

Annual supply of lucerne
biomass to processing
plants
(kg per year)

Areas of production

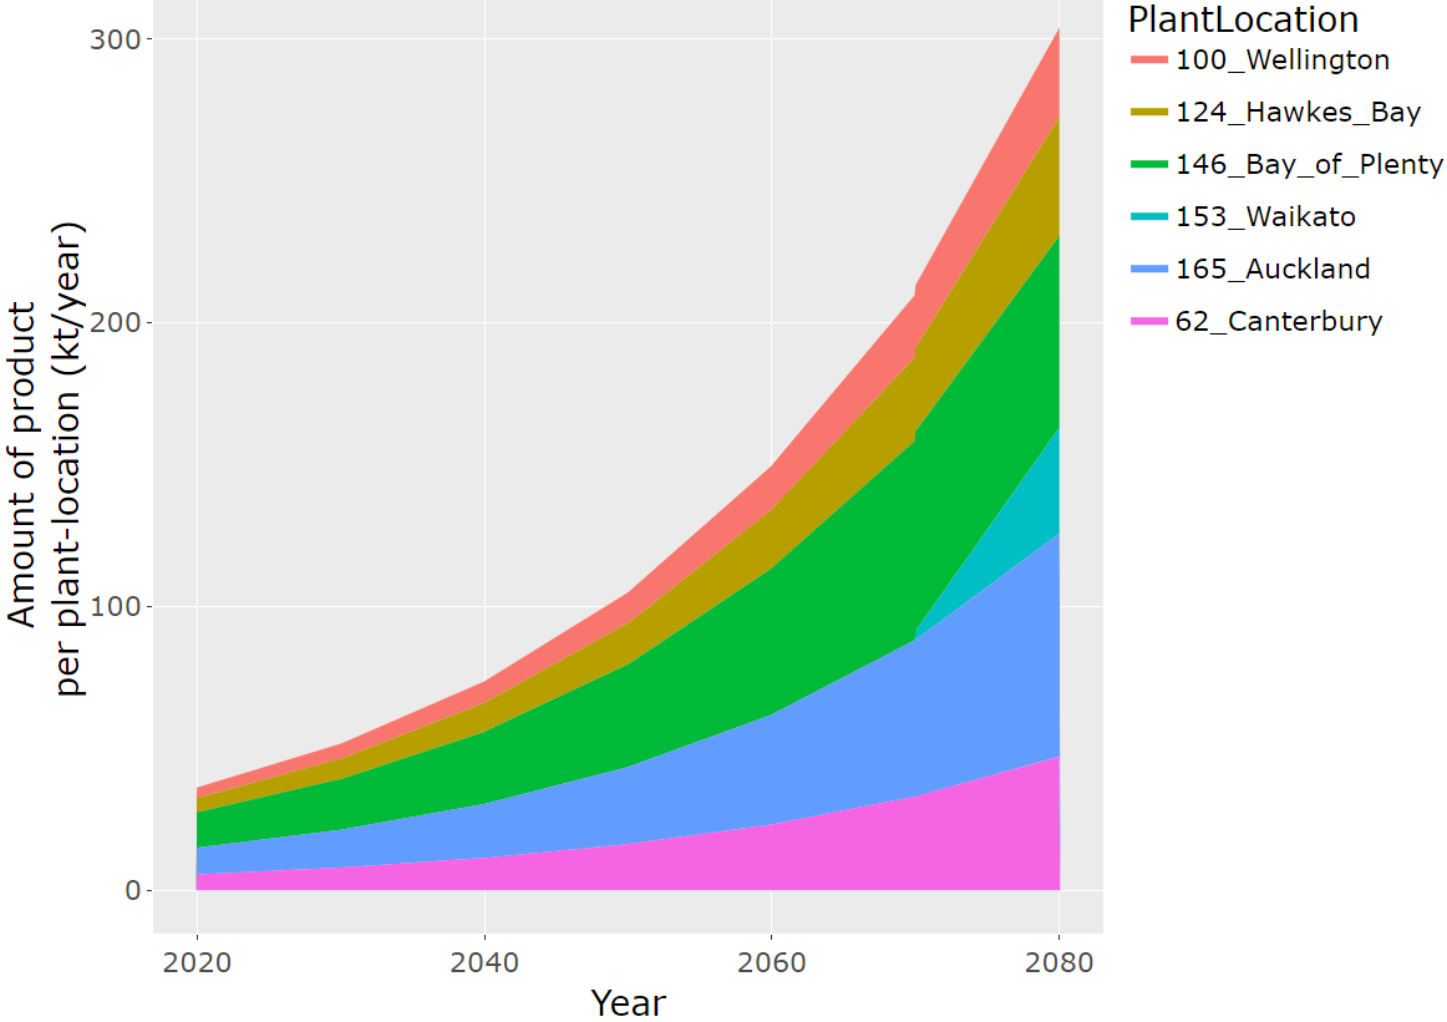

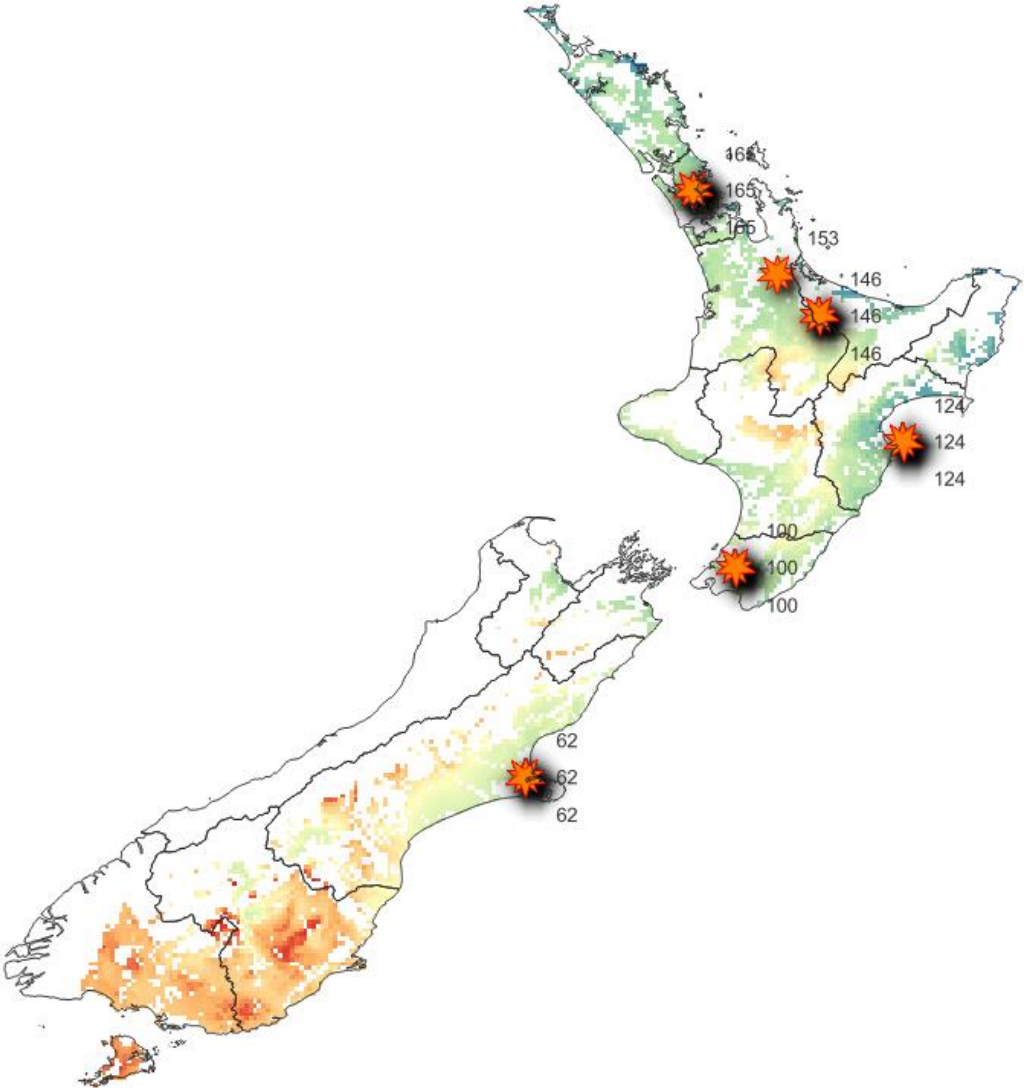

Estimate of lucerne for protein area per region

Planted lucerne areas for protein production per region

Estimated location of processing plants

Preliminary results from model sensitivity tests based on hypothetical protein demand

Conclusions

1. It was possible to spatially represent food supply chain components with APSIM/ATLAS/BeWhere
2. Supply and processing plant locations were allocated in high yielding areas close to demand points
3. Demands (amounts and location) were a key driver of spatial model results
4. For next steps after this first sensitivity test run, focus will be on revised parameterisation of costs
